There being no further business, Board adjourned until December 31, 1918.

W. B. STEPHENS,

Chairman, Board of Supervisors, of Mohave County, State of Arizona.

Attest: MARY KAUS, Clerk.

## MINING NEWS FROM YAVAPAI COUNTY

PRESCOTT, Ariz., Dec. 27.—The record made by the great Verde Mining District of Yavapai County, Ariz., in the production of the red metal and the purchasing of bonds, war savings stamps and the outright subscriptions to the various war organizations speaks for itself of the manner in which the companies and the employees assisted the government during the war period. With the cessation of hostilities there has been no let-up in that district with respect to the desire to bring in more producing mines, according to a recent issue of the Verde Copper News, published at Jerome.

The Gadadun, which is being developed by the Calumet and Arizona Copper company, will soon be equipped with a pump capable of handling the present water development as well as that of the future. Recently General manager W. B. Goehring and Master Mechanic Will R. McKee of the C. and A. visited the property and decided that a pump of 600 to 1000 gallons capacity was required. The present pumps are lifting 318 gallons a minute and it is certain that much more water will be developed as soon as the west crosscut from the 1200 foot station reaches the fault which is its objective. The crosscut has advanced some 600 feet and it has just passed through another sheared zone of quartz porphyry with a little schist. There is much mineralization in the form of iron and iron oxide. This makes at least three such zones through which the crosscut has passed. All of them look promising enough to warrant drifting, but this will not be done until the main north-and-south drift is reached. This probably is 600 or 700 feet ahead of the present face of the crosscut.

Shortly after the first of the year the interurban line between Jerome and Clarkdale will be in operation according to information given by W. H. Archdeacon of the Verde Tunnel and Smelter Railroad company. The grading for the new line is nearly completed and the rails have been laid for more than half the distance between the two towns. The track-layers are working close behind the graders and the two departments of the work will be able to announce completion, within a few days of each other. The second motor car has been delivered and it is expected that the first train will pass over the rails within a month from today and possibly a few days earlier. Each motor car will pull a trailer fitted up, and as soon as the service becomes adjusted it will be possible for Clarkdale travelers to purchase tickets to Jerome Junction by way of Jerome and the U. V. and P. road. The interurban schedule will be so arranged that close connections will be made. It is possible that this service will be extended to Cottonwood and Verde.

Without delay the Verde Combination shaft will be sunk 200 feet deeper and development of the promising showing opened on the 1980 will be prosecuted vigorously on the new level. While sinking is going on work will be continued in the No. 8 south-west drift on the 1080, which has already exposed a big body of schist carrying pyrite and chalcocite. This work was the principal recommendation of Manager Dave Morgan in his annual report which was unanimously adopted. The report shows that for the year ending October 31, the Combination company accomplished 5,039 feet of drifting and cross-cutting at a cost of \$16.67 a foot. The shaft was sunk 402 feet at \$63.91 a foot. The management is confident that within another year, a producing copper will be made of the Verde Combination.

The Consolidated Arizona at Humboldt, is averaging around 1,000,000

pounds a month or 12,000,000 pounds per annum. Under the prevailing price for copper this output has a net value of \$1,545,000, equivalent to about ninety cents a share on the 1,663,000 shares of \$6 par outstanding before tax reductions. This compares with net profits of \$881,816 last year and \$859,014 in 1916 and is more than four times dividend requirements of five cents a share, or twenty cents per annum. It is the expectation of the management that all construction work at the company's Blue Bell and DeSoto mines. Considerable exploratory work is being prosecuted at the company's recently acquired Swatitika silver property, located a short distance from its smelter. At the close of 1917 ore reserves at the Blue Bell mine were estimated at 536,800 tons of 3.10 per cent copper and \$2 in gold and silver and of the De Soto mine 66,200 tons of 3 per cent copper and \$2 gold and silver.

During the past few weeks, the Western Copper company in the Mayer district has attracted much attention. This property is located four miles from Mayer and lying immediately between the Binghamton and Copper Queen holdings on the north and the famous old Stoddard group on the south. If location counts for anything, this group constitutes one of the choicest and most promising properties in the Mayer district, as it straddles the great outcrop 700 feet wide between the two best known and most productive mines yet developed in that district and the surface showings are said to be attractive. The property has been developed to a small extent by a number of shallow shafts and open cuts, all showing mineral, some of which were put down as location work and annual assessment work and others sunk by the present owners to determine the proper location for a permanent working shaft. On the south end of the property, not far from the Stoddard line, several short tunnels have been driven into the schist at either side of the porphyry contact and all these show the same degree of mineralization that is exposed in the shafts and open cuts. Several engineers have examined the ground and all have agreed that its present possibilities are well worth exploring and have also agreed that the location chosen by the present owners for the permanent shaft is the best on the ground. The property is the best on the ground. The property is connected with Mayer road which will require but little repair to make it an easy and inexpensive matter to transport supplies to the mine and ores to the smelter. The ground presents another advantage in the fact that there is a considerable dip in the surface between the Binghamton and the Stoddard and it is expected that the ore bodies will be found at least depth, possibly 300 feet than in the former which is now taking out ore from the 600 level.
